<sup>1</sup> Selectable via SDK (software development kit).

<sup>2</sup> The readout noise values are given as median (med) and root mean square (rms) values, due to the different noise models, which can be used for evaluation. All values are raw data without any filtering.

<sup>3</sup> Based on image sensor datasheet.

### low light mode

When the low light mode is activated, both the high and low gain A/D converter are used as high gain, which means they digitize low intensity pixel values only.

The signal within each pixel is simultaneously digitized by two separate A/D conversion units and added up, which is referred to as correlated multi sampling (CMS). This correlation causes a major reduction of the readout noise, though the usable intrascene dynamic range of the sensor is reduced.

### lightsheet scanning mode

The PCO lightsheet scanning mode is a special readout mode dedicated to lightsheet microscopy. It is based on the rolling shutter mode in which the readout direction of the sensor is from top to bottom.

The standard line time value is 12  $\mu$ s and it can be set from this camera-specific line time up to 2 ms. Compared to the standard operation mode, the lightsheet scanning mode enables the selection of the parameters "Line Time" and "Exposure Lines". This guarantees an optimized synchronization to an existing lightsheet setup which has no selectable speed or timing. It is possible to set a delay prior to the exposure start ("delay lines").

For more information on the corresponding SDK functions, please read our pco.sdk instruction manual.

selectable parameter:  
(only via SDK)

$T_x$  Line Time (12  $\mu$ s ... 2 ms)  
 $L_x$  Exposure Lines (1 ... 2048)

Start Exposure  
End Exposure
